0.1	17/04/2026	Caleb Chen	Initial Draft	

3. APPROVAL & SIGN-OFF

ROLE	NAME	SIGNATURE

4. PRODUCT OVERVIEW

4.1 BACKGROUND

Currently, unlimited leverage is only available via a dedicated premium account type. This creates friction in onboarding and limits adoption across different client segments and brands.

4.2 PRODUCT SUMMARY

Currently, unlimited leverage is only available for a dedicated premium account type, and it supports only a single option (unlimited leverage).

Unlimited leverage phase 2 is to extend unlimited leverage to all account types, allowing clients to freely choose their preferred leverage on the client portal under every account type.

Unlimited Leverage Phase 2 enables all eligible clients across all account types to select unlimited leverage directly from the client portal, without requiring a separate account type.

The system will dynamically manage leverage based on:

- Client equity
- Risk rules (Dynamic Leverage)
- Platform Constraints (symbol / group limits)

4.3 PROBLEM STATEMENT

1. The unlimited leverage account currently has onboarding requirements. Clients must first meet the trading conditions in another account type, then open a separate premium unlimited leverage account, followed by additional internal transfers or deposits. This makes the overall process complicated and inefficient.
2. The current unlimited leverage is only available under the premium account type, which has lower spreads compared to STP. Since IB rebates are based on spread percentage, IBs receive lower rebates, reducing their incentive to promote. If unlimited leverage is made available across all account types, IBs can retain their existing rebate structures and be more motivated to promote.
3. Not all brands have or are willing to introduce a separate account type. Therefore, enabling this feature within existing account types is necessary to achieve meaningful adoption and promotion.

1. Complex Onboarding Flow

Clients must meet conditions in one account, then open a separate premium account and transfer funds, creating friction and drop-off.

2. IB Incentive Misalignment

Unlimited leverage is tied to low-spread accounts, reducing IB rebates and limiting promotion incentives.

3. Limited Scalability Across Brands

Not all brands support or want separate account types, restricting adoption of unlimited leverage.

4.4 OBJECTIVES

1. To extend unlimited leverage across all account types.
2. To gradually guide clients toward a trading model without credit incentives.

4.4.1 PRIMARY OBJECTIVES

- Enable unlimited leverage section across all account types
- Simplify user experience by removing multi-account dependency

4.4.2 SECONDARY OBJECTIVES

- Maintain system stability under increased trading activity
- Ensure risk is controlled via automated leverage adjustments

4.5 SUCCESS METRICS (KPIs)

Adoption & Growth

1. Achieve at least 10% adoption rate of unlimited leverage among active clients within 6 months post-launch.
2. Increase total trading volume from unlimited leverage users by at least 10% within 3 months post-launch, compared to their baseline trading activity prior to adoption.

4.5.1 Adoption & Growth (0-6 months)

- $\geq 10\%$ of active clients adopt unlimited leverage
- $\geq 10\%$ increase in trading volume among adopters (vs baseline)

System Stability & Risk Control

1. Maintain zero critical trading incidents caused by system logic errors after launch.
2. Limit customer complaints related to system logic issues to fewer than 3 critical cases within the first 2 weeks post-launch.

4.5.2 Stability & Risk (0-2 weeks post-launch)

- Zero critical system incidents
- <3 critical complaints related to leverage logic

Client Experience

1. Achieve a Customer Satisfaction Score of $\geq 80\%$ for users utilizing unlimited leverage within the first 3 months.

4.5.3 Client Experience (0-3 months)

- $\geq 80\%$ satisfaction score among users

5. SCOPE

5.1 IN SCOPE

1. Enable unlimited leverage selection across all account types.
2. Implement system integration and handling between the plugin and the BIT Manager API when changing client leverage
3. Remove credit for clients using unlimited leverage.
4. Allow unlimited leverage to be correctly displayed on different platforms, including APP, Webtrader, MQ, Tradingview.
5. Support unlimited leverage within the social trading system.
6. Ensure that all database records and displayed data are accurate, and that all retrieved information remains correctly mapped and consistent across systems.
7. Ensure logs are clearly labeled and structured, without creating unnecessary system loads, to support efficient investigation and customer complaint handling.
8. Develop a monitoring plugin to verify that order settings are correctly applied and enforced.
 - Enable leverage section (including unlimited) across all account types
 - Real-time leverage adjustment based on equity tiers
 - Integration with BIT Manager API or plugin-based leverage logic
 - Removal of credit for unlimited leverage users
 - Support across platforms:
 - Client Portal

- MT5
- WebTrader
- TradingView
- Social trading compatibility
- Monitoring and logging for leverage behaviour
- Risk monitoring and anomaly detection

5.2 OUT OF SCOPE

1. Automated Rollback / Self-Healing Systems

- Fully automated rollback or self-recovery mechanisms
- Intelligent failover systems
- Fully automated self-healing systems
- Intelligent failover mechanisms

6. USER SEGMENTS

1. Client Type: Retail, IB, Hybrid users
2. Account Types: ECN, STP, Perpetual, Premium, Social Trading, Trading View
3. Brand : TBC
4. Account Currencies : All currencies

6.1 CLIENT TYPES

- Retail traders
- Introducing Brokers (IBs)
- Hybrid users

6.2 ACCOUNT TYPES

- ECN
- STP

- Perpetual
- Premium
- Social Trading

7. ELIGIBILITY CRITERIA

Clients must meet the following before selecting unlimited leverage:

- Minimum 10 trades within 12 months
- Minimum 3 lots traded
- Supported instruments:
 - Forex
 - Gold
 - Oil
 - BTCUSD

8. FUNCTIONAL REQUIREMENTS

1. Clients shall be able to **freely select** their preferred leverage via the Client Portal, including unlimited leverage (up to 1:2,000,000,000).
2. The system shall monitor client equity in real time. If the client's equity no longer meets the required threshold, the system shall automatically and immediately adjust the leverage to the appropriate level.

Equity	Leverage
$0 \leq \text{Equity} < 5000$	1:unlimited
$5000 \leq \text{Equity} < 30,000$	1:2000
$30,000 \leq \text{Equity} < 100,000$	1:1000
$\text{Equity} \geq 100,000$	1:500

3. Clients shall be subject to Dynamic Leverage (DL) rules during specified time periods.

a. Margin calculation logic during ST :

- A – Net exposure before a certain trade action (+ Buy / – Sell)
 $A = |b| - |s|$
- B – Net exposure after a certain trade action within ST (+ Buy / – Sell)
 $B = |b'| - |s'|$
- M(A), M(B) – Margin for a position
- MR – Margin per lot during Special Time (SP)

Calculation Rules:

Net exposure decreases (no flip, no hedge)

If $A \cdot B > 0$ AND $|B| < |A|$, then:

$$M(B) = M(A) \times |B / A|$$

Net exposure increases or remains the same (no flip, no hedge)

If $A \cdot B > 0$ AND $|B| \geq |A|$, then:

$$M(B) = M(A) + MR \times (|B| - |A|)$$

Flip or full hedge

If $A \cdot B \leq 0$, then:

$$M(B) = MR \times |B|$$

- b. When Dynamic Leverage (DL) rules expire, the effective leverage shall revert to the minimum value among MQ Client-selected leverage, MQ Symbol-level leverage, and MQ Group-level leverage, and all other applicable plugin rules.
- c. During Dynamic Leverage specified time periods, clients shall be allowed to freely adjust their selected leverage.
- d. During Dynamic Leverage (DL) specified time periods, equity-based leverage rules defined in the plugin shall continue to be applied.
- e. The DL rules apply to the following order actions: Market order opening and closing, Pending orders, Bulk operations, partial close, close by, multiple close by functions.
- f. When leverage changed during ST due to MQ user leverage change or leverage change due to equity tier, only positions outside ST will be affected:

Net exposure decreases (no flip, no hedge)

If $A \cdot B > 0$ AND $|B| < |A|$, then:

$$M(B) = M(A) \times |B / A|$$

$$E_{\text{not_sp}}(B)' = E_{\text{not_sp}}(A) \times |B / A|$$

$$E_{\text{sp}}(B)' = E_{\text{sp}}(A) \times |B / A|$$

$$M(B)' = E_not_sp(A) \times |B / A| \times MR_not_sp' + E_sp(A) \times |B / A| \times MR_sp$$

Net exposure increases or remains the same (no flip, no hedge)

If $A \cdot B > 0$ AND $|B| \geq |A|$, then:

$$M(B) = M(A) + MR_sp \times (|B| - |A|)$$

$$E_not_sp(B)' = E_not_sp(A)$$

$$E_sp(B)' = E_sp(A) + (|B| - |A|)$$

$$M(B)' = E_not_sp(A) \times MR_not_sp' + (E_sp(A) + |B| - |A|) \times MR_sp$$

Flip or full hedge

If $A \cdot B \leq 0$, then:

$$M(B) = MR_sp \times |B|$$

$$E_not_sp(B)' = 0$$

$$E_sp(B)' = |B|$$

$$M(B)' = |B| \times MR_sp$$

4. The **effective leverage** applied to a client shall be the **minimum** of the following:
 - min(client leverage vs plugin rule)
 - min(Symbol-level leverage vs plugin rule)
 - min(**Client Group-level leverage** vs plugin rule)
5. For clients in regions where unlimited leverage is enabled, the Stop-Out Level and Margin Call Level on group setting should be changed to 0% and 30%.
6. For clients in regions where unlimited leverage is enabled, the system shall charge trading fees at order opening on MT5.
7. For clients in regions where unlimited leverage is enabled, no credit is allowed.
8. The user must complete at least 10 trades within one year, and open a total trading volume of at least 3 lots, in order to qualify and choose unlimited leverage. Supported products include Forex, Gold, Oil, and BTCUSD.
9. No Money Protection is triggered if any of the following conditions is met:
 - Equity — Margin ≤ 0
 - Equity ≤ 0
 - Free Margin ≤ 0
 - Equity — Fee ≤ 0 (Fee includes spread + commission)

- a. The No Money protection rules apply to the following order actions: Market order opening and closing, Pending orders, Bulk operations..
- b. Take Profit (TP) and Stop Loss (SL) orders are not subject to the above rejection rules. TP/SL orders shall be executed directly, regardless of No Money protection conditions.
- c. If the client's Free Margin after the trade is greater than the Free Margin before the trade, the transaction shall not be rejected, even if No Money protection conditions are triggered.

8.1 LEVERAGE SECTION

- Clients can select leverage via the Client Portal
- "Unlimited Leverage" is defined as system-defined maximum leverage, subject to:
 - Equity rules
 - Dynamic Leverage (DL)
 - Symbol / Group constraints

8.2 EQUITY-BASED LEVERAGE ADJUSTMENT

Leverage is dynamically adjusted based on real-time equity:

Equity Range	Max Leverage
$0 \leq E < 5000$	Unlimited
$5000 \leq E < 30000$	1:2000
$30000 \leq E < 100000$	1:1000
$E \geq 100000$	1:500

- Adjustment is applied immediately upon threshold crossing

8.3 EFFECTIVE LEVERAGE RULE

The final leverage applied is:

$L_{\text{effective}} = \min(L_{\text{client}}, L_{\text{symbol}}, L_{\text{group}}, L_{\text{plugin}})$

8.4 DYNAMIC LEVERAGE (DL)

8.4.1 Definitions

Let:

- b = total buy volume before trade
- s = total sell volume before trade
- b', s' = volumes after trade
 - $A = |b| - |s|$ (net exposure before)
 - $B = |b'| - |s'|$ (net exposure after)
- $M(A), M(B)$ = margin before / after
- MR = margin rate per lot during Special Time (ST)

8.4.2 Margin Calculation Rules

Case 1: Net Exposure Decreases (Same Direction)

Condition:

$$A \cdot B > 0 \text{ AND } |B| < |A|$$

Then:

$$M(B) = M(A) \times |B / A|$$

Case 2: Net Exposure Increases or Remains

Condition:

$$A \cdot B > 0 \text{ AND } |B| \geq |A|$$

Then:

$$M(B) = M(A) + MR \times (|B| - |A|)$$

Case 3: Flip or Full Hedge

Condition:

$$A \cdot B \leq 0$$

Then:

$$M(B) = MR \times |B|$$

8.4.3 Special Time (ST) Position Separation

Define:

- $Enot_sp$: exposure outside ST
- Esp : exposure during ST

8.4.4 Leverage Change During ST

When leverage changes due to:

- Client selection OR
- Equity tier change

Only non-ST positions are affected.

Case 1: Exposure Decreases

$$Enot_sp(B)' = Enot_sp(A) \times |B / A|$$

$$Esp(B)' = Esp(A) \times |B / A|$$

$$M(B)' = Enot_sp(A) \times |B / A| \times MRnot_sp + Esp(A) \times |B / A| \times MRsp$$

Case 2: Exposure Increases

$$Enot_sp(B)' = Enot_sp(A)$$

$$Esp(B)' = Esp(A) + (|B| - |A|)$$

$$M(B)' = Enot_sp(A) \times MRnot_sp + (Esp(A) + |B| - |A|) \times MRsp$$

Case 3: Flip / Full Hedge

$$Enot_sp(B)' = 0$$

$$Esp(B)' = |B|$$

$$M(B)' = |B| \times MRsp$$

8.4.5 DL Behavior Rules

- Applies to:
 - Market orders
 - Pending orders

- Bulk operations
- Partial close
- Close-by
- During DL:
 - Clients can still adjust leverage
 - Equity rules still apply
- After DL ends:

$L_{\text{effective}} = \min(\text{all leverage constraints})$

8.5 Risk & Order Validation Rules

8.5.1 Order Rejection Conditions

Orders are rejected if:

$\text{Equity} - \text{Margin} \leq 0$

$\text{Equity} \leq 0$

$\text{Free Margin} \leq 0$

$\text{Equity} - \text{Fee} \leq 0$

Where:

$\text{Fee} = \text{spread} + \text{commission}$

8.5.2 Exceptions

- TP / SL orders are always executed
- Orders that increase Free Margin are allowed:

$\text{Free Margin}(\text{after}) > \text{Free Margin}(\text{before})$

8.6 Region-Specific Configuration

For regions with unlimited leverage enabled:

- Stop-out level = 0%
- Margin call level = 30%

- Commission charged at order opening
- Credit disabled

9. NON-FUNCTIONAL REQUIREMENTS

1. The system shall be scalable to handle increased trading volume and user activity without performance degradation or introducing unacceptable server load under normal and peak conditions, and shall ensure high reliability and stability, with no critical failures or unexpected behavior across all supported trading scenarios.
2. Admin-side logs shall be clear, readable, and well-structured, ensuring full traceability of leverage changes, rule application, and order processing, and enabling efficient troubleshooting, audit, compliance review, and post-incident analysis.
3. The system shall be fully compatible with other plugins and must not create logical conflicts with them, including SSL, HTL, DD, and NOP. In particular, when DL is active during specified periods, other plugins must still be able to operate concurrently without issue.
4. During plugin version upgrades or deployments, the system shall ensure that existing positions (legacy/open positions) are handled and calculated correctly without impact.
5. The system shall record and store the effective leverage applied to each client at the time of trading, enabling future analysis and evaluation of performance under different leverage conditions.
6. The system shall support real-time processing of leverage calculation, equity monitoring, and order validation, and provide monitoring and alerting mechanisms to detect anomalies in leverage application, trading behavior, and system performance, without noticeable delay or latency.

9.1 PERFORMANCE

- Handle increased trading load without degradation

9.2 RELIABILITY

- No critical failures across trading scenarios

9.3 COMPATIBILITY

- Must work with existing plugins:
 - SSL, HTL, DD, NOP
-

9.4 OBSERVABILITY

- Real-time monitoring and alerting
- Full traceability of leverage decisions

10. DEPENDENCIES

1. Changes to client leverage must be supported either through updates to the BIT Manager API or via adjustments to the plugin margin rate logic. One unified approach must be defined and implemented.
2. Client equity must be monitored and updated in real time. The current BIT logic updates leverage due to equity scan at a two-day interval, which needs to be revised to support real-time processing.
3. If leverage is dynamically adjusted based on real-time equity, there is a risk of forced liquidation due to stop-out level constraints. Therefore, the client stop-out level must be adjusted to 0%.
4. If the stop-out level is set to 0%, commission must be charged at order opening, and the “full hedge stop out” on group level must be enabled.
5. Due to the stop-out level being set to 0%, regions that are offering unlimited leverage must discontinue credit offerings.
6. All related plugins must be fully compatible with each other to ensure consistent behavior and avoid conflicts in leverage, margin, and order processing logic.
7. Alignment across all related systems (trading platform, backend, data reporting, and anti-fraud control) to ensure consistent application of leverage, margin, and stop-out logic.
8. Historical data, client logs, and account statements must correctly reflect leverage changes and trading results under unlimited leverage conditions.
9. A phased rollout plan (e.g., region-based or account-based) must be defined to monitor system stability and mitigate risks during full deployment
10. A rollback or fallback mechanism must be defined in case of system failure or abnormal behavior during or after rollout.
11. Risk control mechanisms must be enhanced to prevent potential abuse of unlimited leverage, including abnormal trading behavior, latency arbitrage, and gap trading...
12. Real-time monitoring and alerting mechanisms must be implemented to detect anomalies in leverage application, trading behavior, and system performance.

13. Clear communication and risk disclosure must be provided to clients regarding the use of unlimited leverage, including associated risks and trading conditions.
 14. Existing accounts and positions must be handled without disruption, including proper migration of leverage settings and open trades.
 15. System performance and server load impact must be evaluated and optimized to handle increased trading activity under unlimited leverage conditions.
 16. The implementation must comply with regional regulatory requirements and restrictions related to leverage and trading conditions.
- Real-time equity monitoring (replace current 2-day scan)
 - BIT Manager API or plugin logic standardization
 - Cross-system alignment:
 - Trading platform
 - Backend
 - Reporting
 - Anti-fraud systems
 - Regulatory compliance by region
 - Phased rollout strategy
 - Rollback mechanism definition

11. RISK MANAGEMENT REQUIREMENTS

1. Risk Monitoring & Health Check

The system shall implement risk monitoring mechanisms to ensure that all critical processes, including equity monitoring and Special Time (ST) rule application, are functioning correctly through periodic health checks and aggregated metrics monitoring.

Plugins rules shall be validated across trigger, execution, and outcome levels, with anomaly detection and real-time alerting in place.

Order-level verification shall be performed through controlled sampling and targeted investigation to avoid excessive system load.

All detected issues shall be tracked in a centralized backlog with defined ownership and resolution plans.

11.1 MONITORING

- Health checks for:
 - Equity monitoring
 - DL rule execution
 - Anomaly detection with alerts
-

2. Rollback & Recovery Mechanism

The system shall support rollback and recovery mechanisms in case of critical system issues, abnormal trading behavior, or unexpected risk exposure.

Rollback shall revert the system to one of the following safe states:

Baseline Mode

- Disable unlimited leverage
- Revert to standard MQ leverage logic, with a maximum leverage of 1:1000

Degraded Mode

- Keep unlimited leverage enabled
- disable high-risk rules (e.g., Dynamic Leverage, advanced plugin rules)

Configuration Rollback

- Revert plugin YAML file to a previously validated version

Rollback actions shall prioritize restoring system stability and preventing abnormal trading behavior or excessive risk exposure.

11.2 ROLLBACK STRATEGY

Baseline Mode

- Disable unlimited leverage
- Revert to max 1:1000

Degraded Mode

- Keep unlimited leverage
- Disable high-risk rules (DL, advanced plugins)

Configuration Rollback

- Revert to previous validated config
-

3. Configuration Validation

The system shall validate all configuration changes before activation to ensure correctness and prevent misconfiguration.

Validation shall include:

- Verification of leverage configuration validity
- Detection of conflicts within YAML rule definitions
- Validation of margin rate settings for logical consistency

11.3 RISK CONTROLS

- Detect abnormal trading patterns:
 - Latency arbitrage
 - Gap trading
- Controlled sampling for order validation

12. REPORTING REQUIREMENTS

1. The system shall provide reporting to evaluate the effectiveness of the unlimited leverage rollout, including:

- Key performance metrics of unlimited leverage users, including:
 - Trading volume
 - Net company PnL
 - RFR (Revenue-to-Funding Ratio)
 - RR (Risk Ratio)
 - DPM (Deposit per Margin)
 - RFDPM (Revenue per Funding / Deposit per Margin)
 - Deposit, Net Deposit
 - FTD (First-Time Deposit)
 - FTT (First-Time Trade)
 - Active User
- Comparison of trading behavior before and after adoption of unlimited leverage, including:
 - Average trading volume (lots)

- Trading frequency
- Holding time
- Client retention and activity metrics, including:
 - Active user rate
 - Retention rate
- Comparative analysis between unlimited leverage (UL) and non-unlimited leverage users, including:
 - Client Win rate (%)
 - Ticket Win rate (%)
 - Stop-out rate (%)
 - Wipe-out amount

Track performance of unlimited leverage:

12.1 BUSINESS METRICS

- Trading volume
- Net PnL
- Deposit / Net Deposit
- FTD / FTT

12.2 RISKS METRICS

- Risk Ratio
- Stop-out rate
- Wipe-out amount

12.3 BEHAVIORAL METRICS

- Trading frequency
- Holding time
- Retention time

12.4 COMPARATIVE ANALYSIS

- UL vs Non-UL users:
 - Win rate
 - Ticket win rate

- Activity

13. OPEN QUESTIONS

1. When changing client leverage, should it be handled through the logic of the BIT Manager API, or by setting a unified leverage of 1:2,000,000,000 via the plugin and achieving it through adjustments to the order margin rate logic?
 2. What is the rollout strategy for enabling unlimited leverage, including phased deployment (e.g., by server, region, or client group), monitoring criteria for progression between phases, and rollback conditions in case of abnormal behavior, to ensure controlled risk exposure during release?
1. Should leverage be controlled via:
 - BIT Manager API, or
 - Plugin-based margin logic?
 2. What is the rollout strategy?
 - Region-based?
 - Server-based?
 - Client segment-based?
